
Necessity is the Mother of Invention

At EIC Global Solutions, our engineers and scientists recognize that each new technological revolution, intended to enhance our quality of life, ultimately has its drawbacks. We therefore need to find other better ways and means of ensuring our well-being. Recognizing this need, EIC consistently develops new and innovative solutions to relieve us from such agonies. We are currently developing several patent pending products. New products on the drawing table include dual phase liquid level probes to monitor multiphase liquid level in a subsurface environment, shoreline multilevel booms to protect our precious beaches from oil spills, silt protection fences to keep our water clean, and other products.

Innovation for a Better World!

Telephone Interceptor ..is our Final Answer!

Snooze Not Lose

Silence Please!

Imagine a world that affords a moment of silence from the constant ringing of the telephones. Impossible, you say. In this day and age the phone rings at the most inopportune moment....shortly after a child has begun a nap, during a relaxing bath, while you are enjoying an afternoon nap, ... We agree. The telemarketers, unknown callers, and even friends or family have no clue that you desire a moment of privacy. Multiple telephone sets in a household exponentially exasperate the situation. How, then, can you be rid of this annoyance?

Why are conventional methods ineffective?

With a typical telephone, one can set the ringer "off" to silence the phones. However, this approach requires you to turn off all the telephones in a house. To later receive telephone calls, you must remember to turn the ringer back "on." Taking the handset off the hook will prevent your phone from ringing, but you cannot receive or place outgoing calls. Some telephone systems employ a "do not disturb (DND)" button that inhibits any notification of incoming calls once the button is activated. However, users often forget to release the DND function thus missing incoming calls. Furthermore, to silence all telephones in a typical household, the DND must be enabled in each telephone set.

Finally, there is a Solution!!

After years of research, finally we have a solution - The Telephone Interceptor (TI). The TI is a patent pending method and apparatus for intercepting and, if necessary, delaying incoming telephone calls on a telephone channel in a household.

Telephone Interceptor

Plug in the TI into any of the telephone receptacles in your home. At the click of a button, stop those annoying phone calls for the next 30 minutes. Click twice, and the ringer will be silent for the next 1 hour. Additional clicks, will snooze the ringer for hours.

SNOOZE NOT LOSE

Do not despair. While snoozing you can still receive a notification of an incoming call by visual display on the TI, on your TV, on your computer, or other methods. If you choose not to answer the telephone, the caller will hear an outgoing message to call back later. However, you can always place outgoing calls while the TI is on. At the end of the snooze period, the interceptor automatically returns the channel to normal condition allowing the telephone sets to ring normally. The TI technology can be incorporated into a traditional telephone set or programmed at the central office of a telephone exchange to intercept the calls.

TELEPHONE INTERCEPTOR FEATURES

- Prevents ringing of all telephones in a house, with the click of a button.
- Snooze from 15 minutes to over 4 hours.
- Receive visual notification on the interceptor, telephone set, TV, or computer.
- Activate the interceptor feature by punching a code on your telephone set.
- Place outgoing calls without interruption.
